

Cotton Diseases in 2019

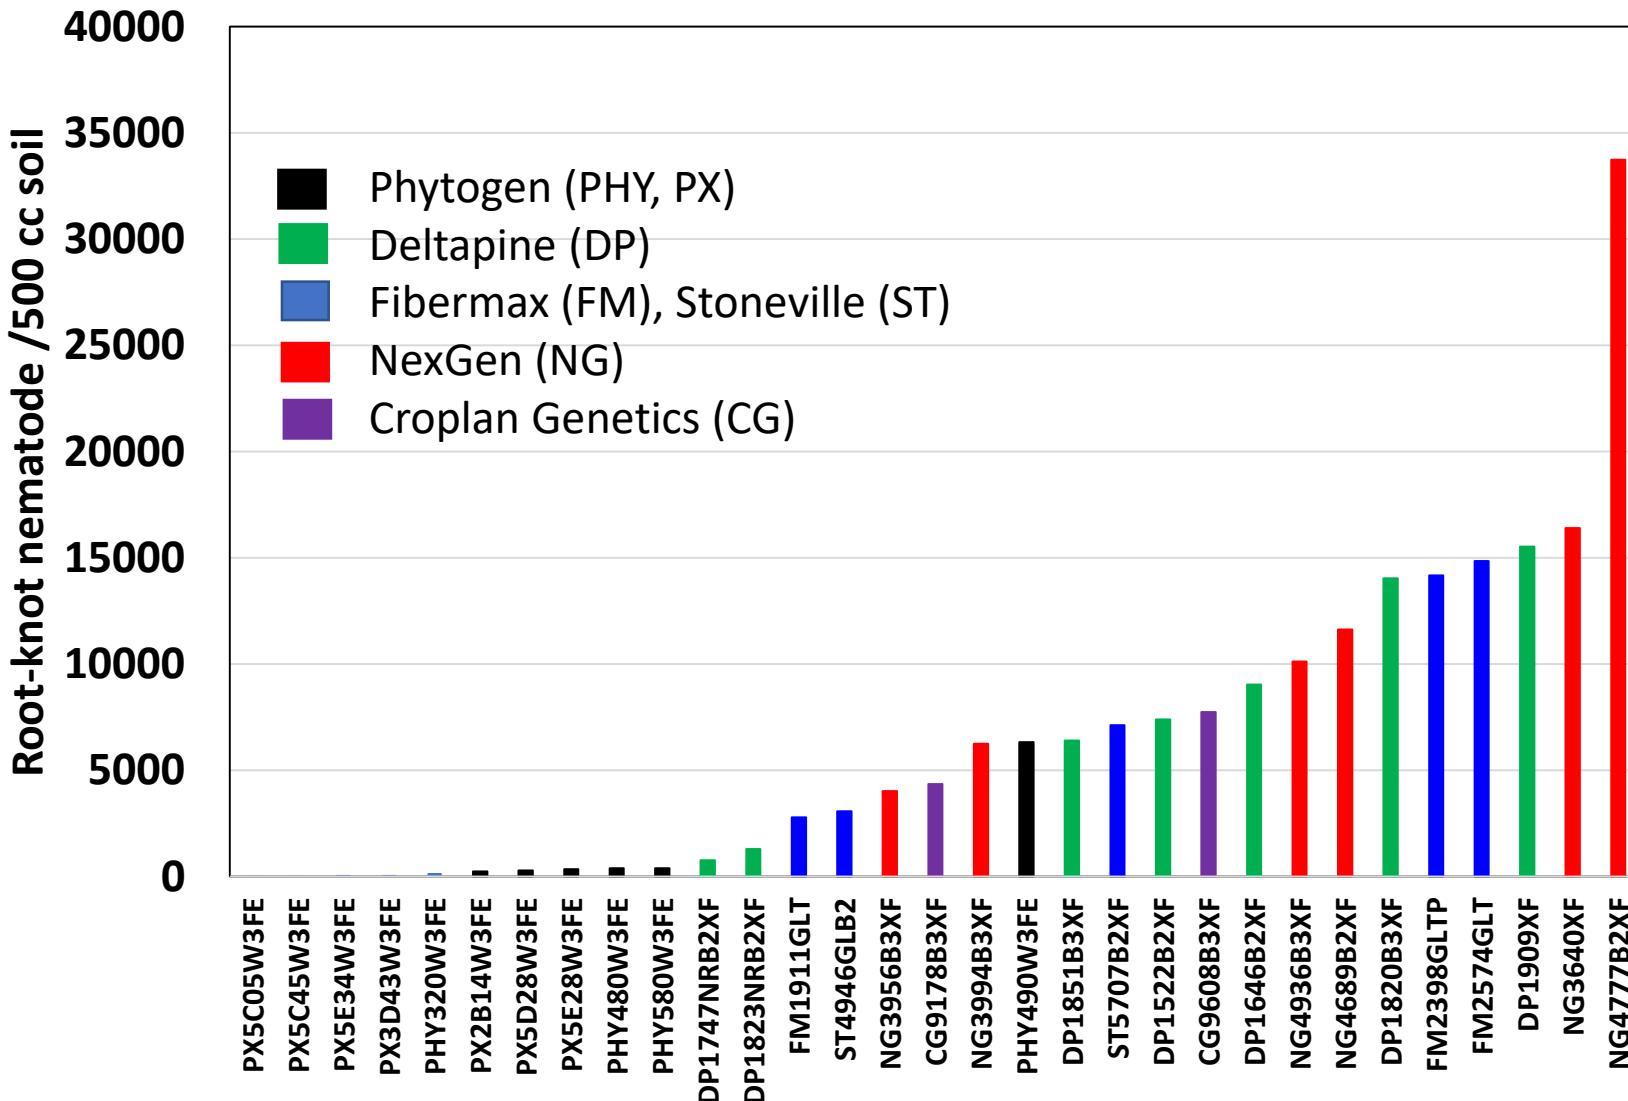

Terry Wheeler

Texas A&M AgriLife Research

Lubbock

- **Seedling Diseases:** Poor root growth and emergence north and east of Lubbock. Probably due to cool and wet conditions. Not necessarily seedling disease but contributed.
- **Fusarium Wilt:** To be covered by Cecilia Monclova-Santana
- **Nematodes:** Significant problem in 2019
- **Bacterial blight:** No problems in 2019
- **Verticillium wilt:** Probably none to minimal losses in 2019

ST 4946GLB2

NG 4545B2XF

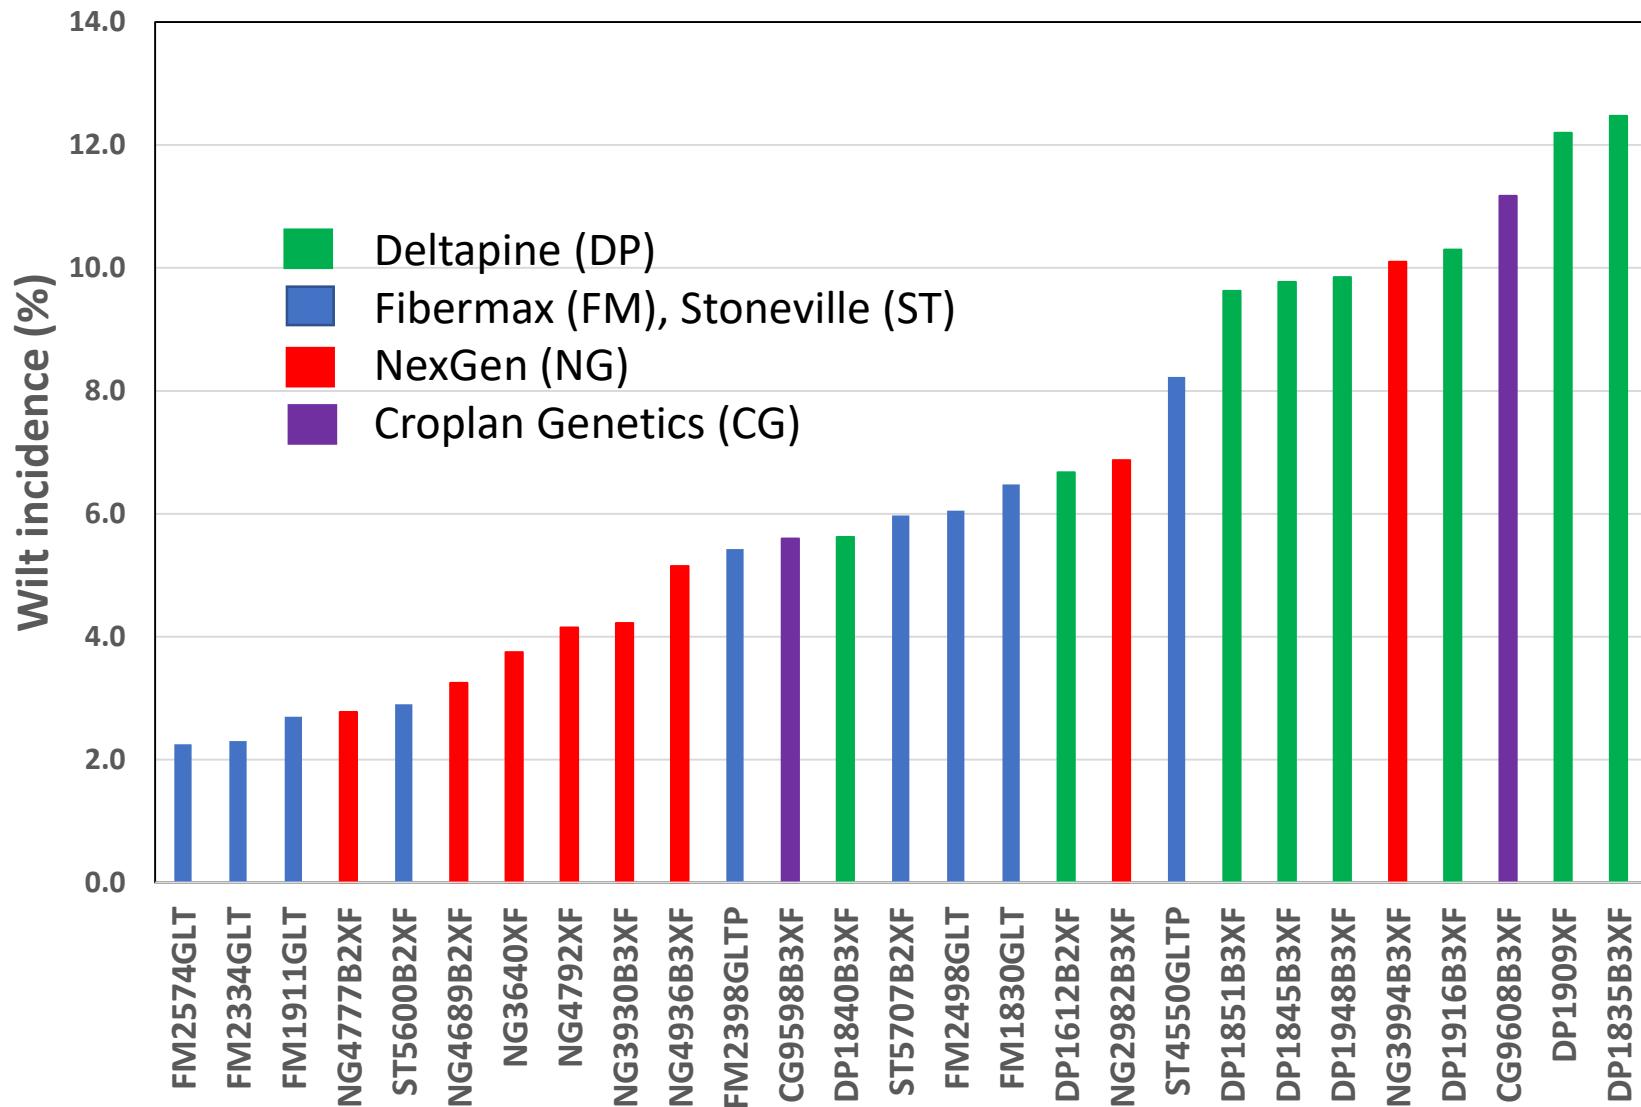

**Varieties with Reniform nematode resistance are
very close to being available**

**Chemical control does not appear to be as
effective as the new resistant varieties.**

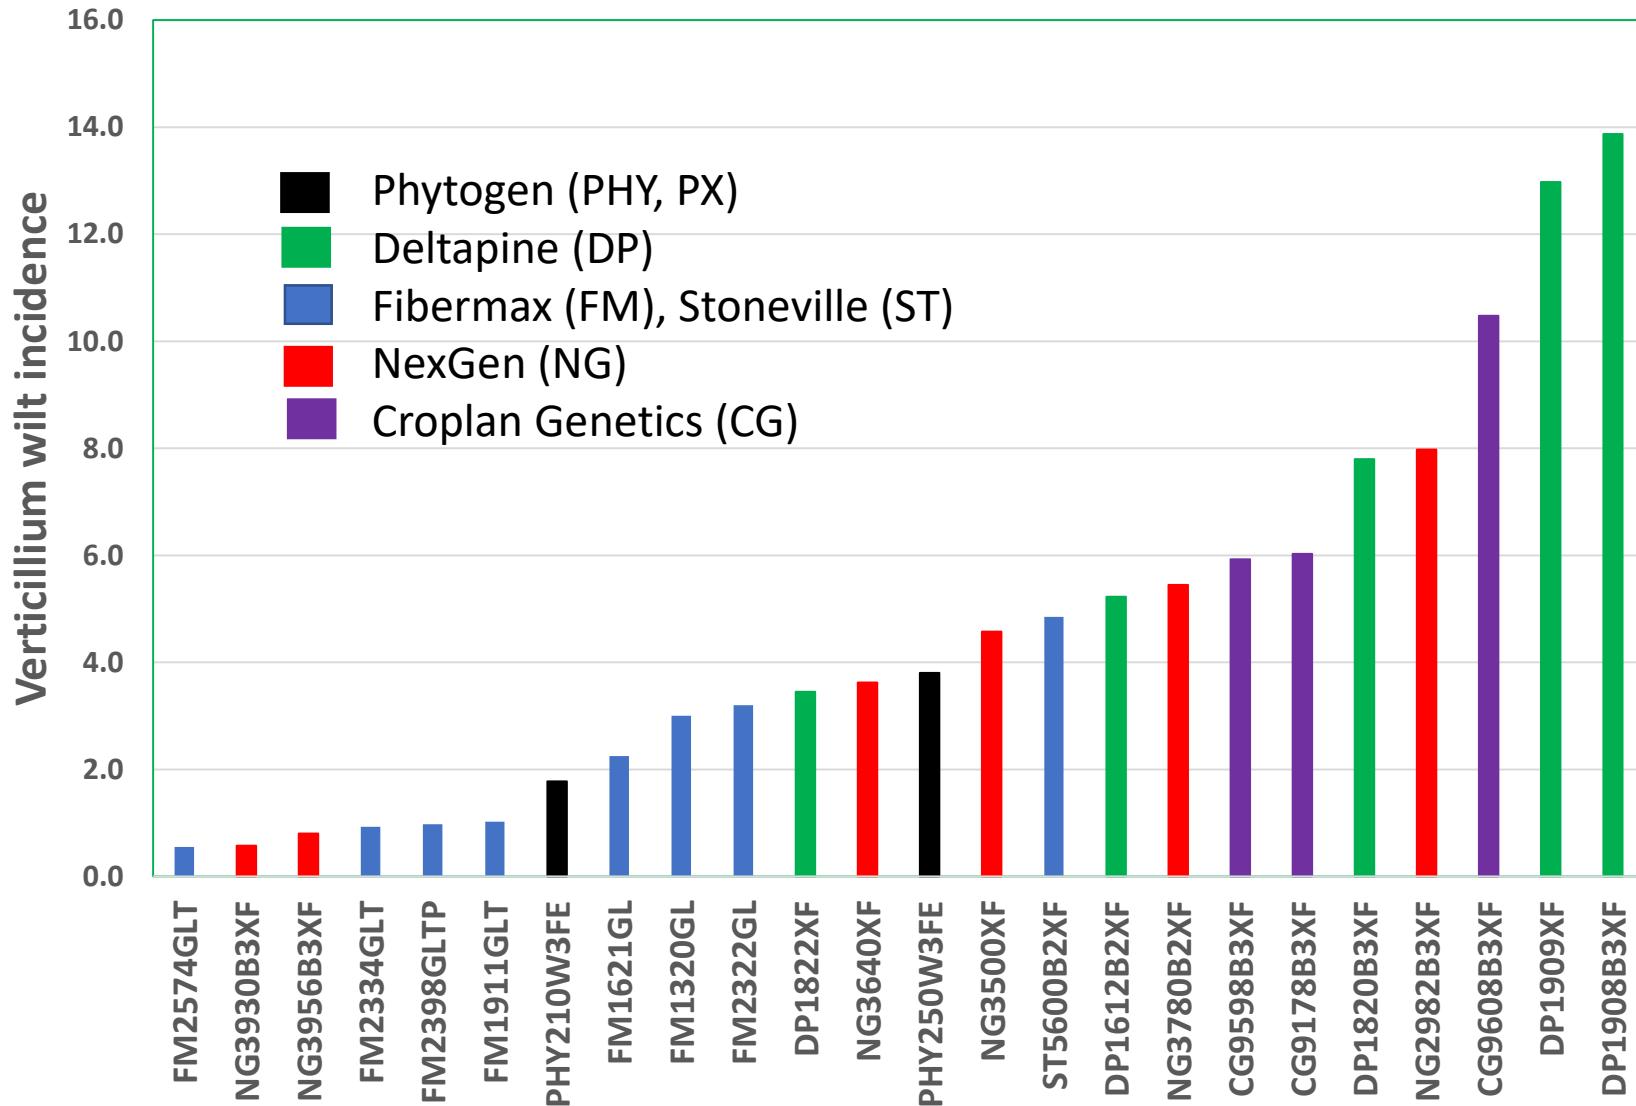

Verticillium Wilt

Incidence of Verticillium wilt in Hockley co.

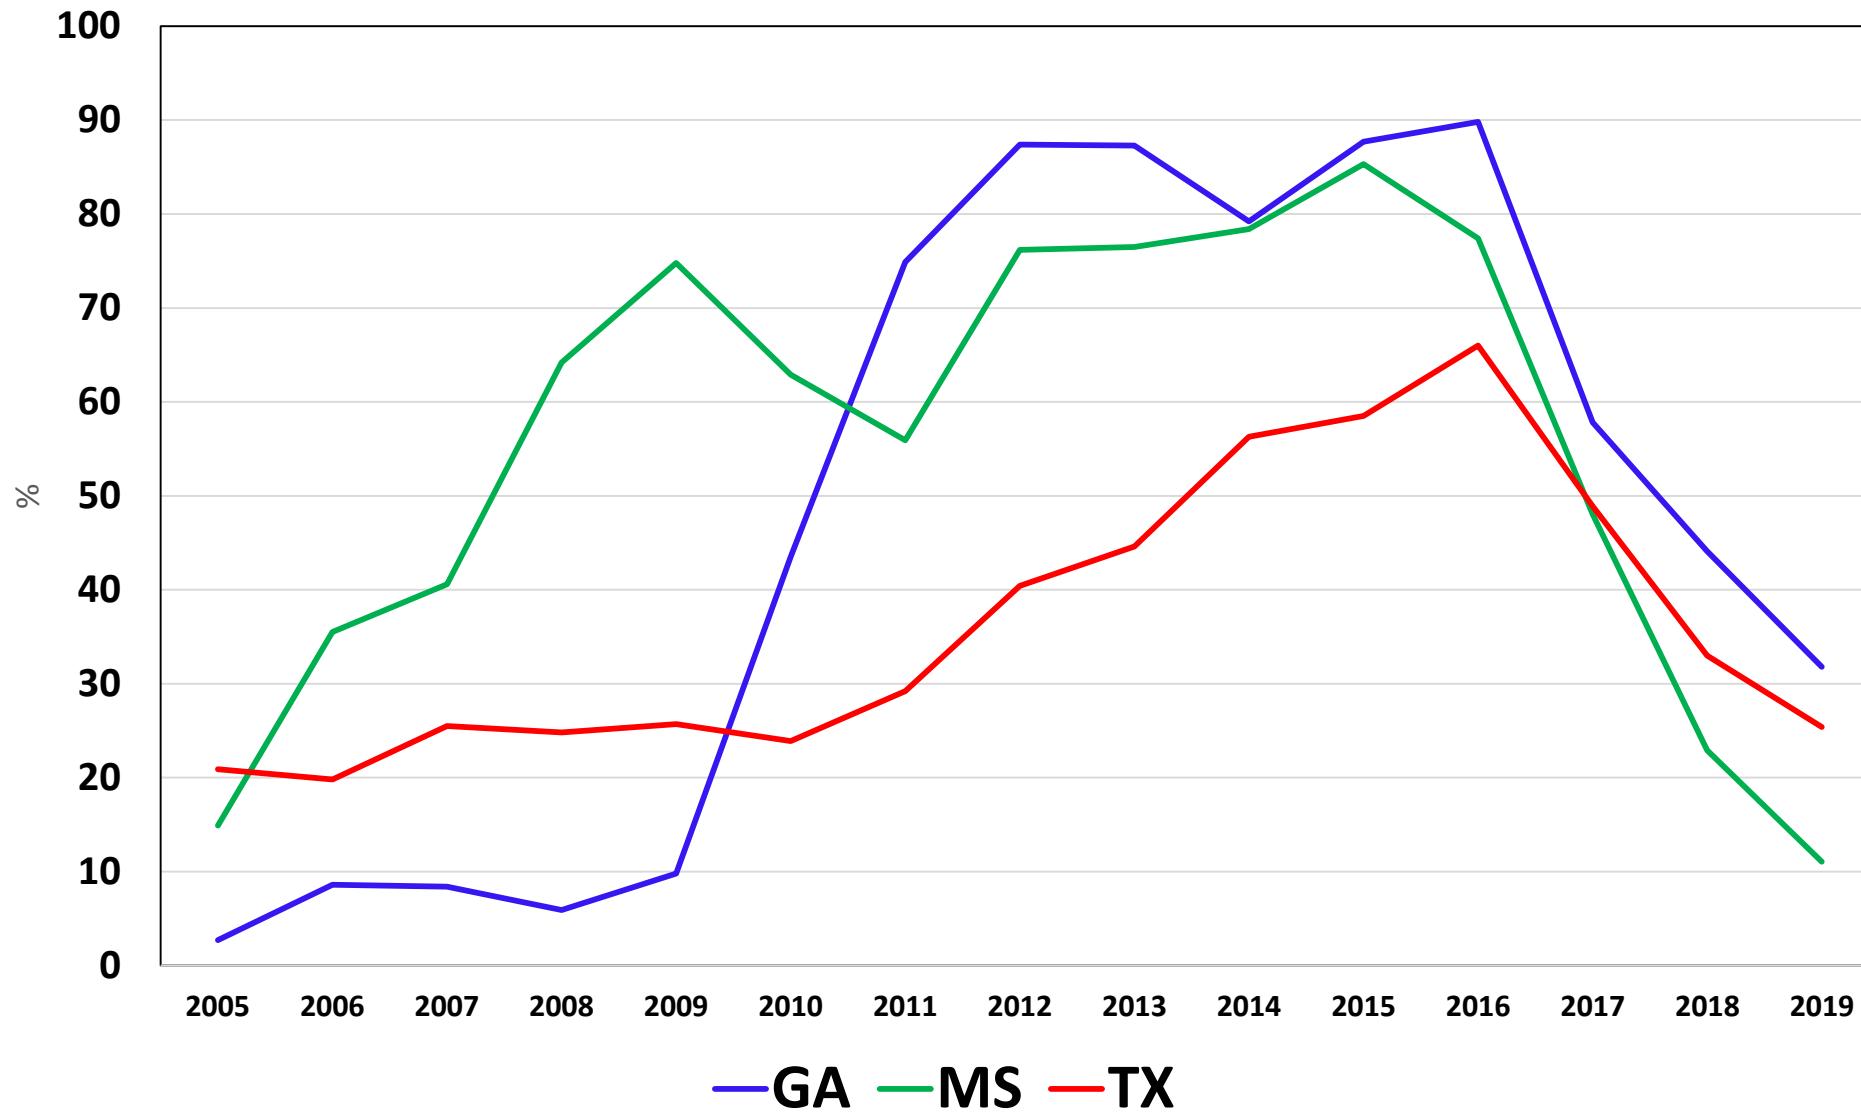

Wilt incidence at a test near Plainview

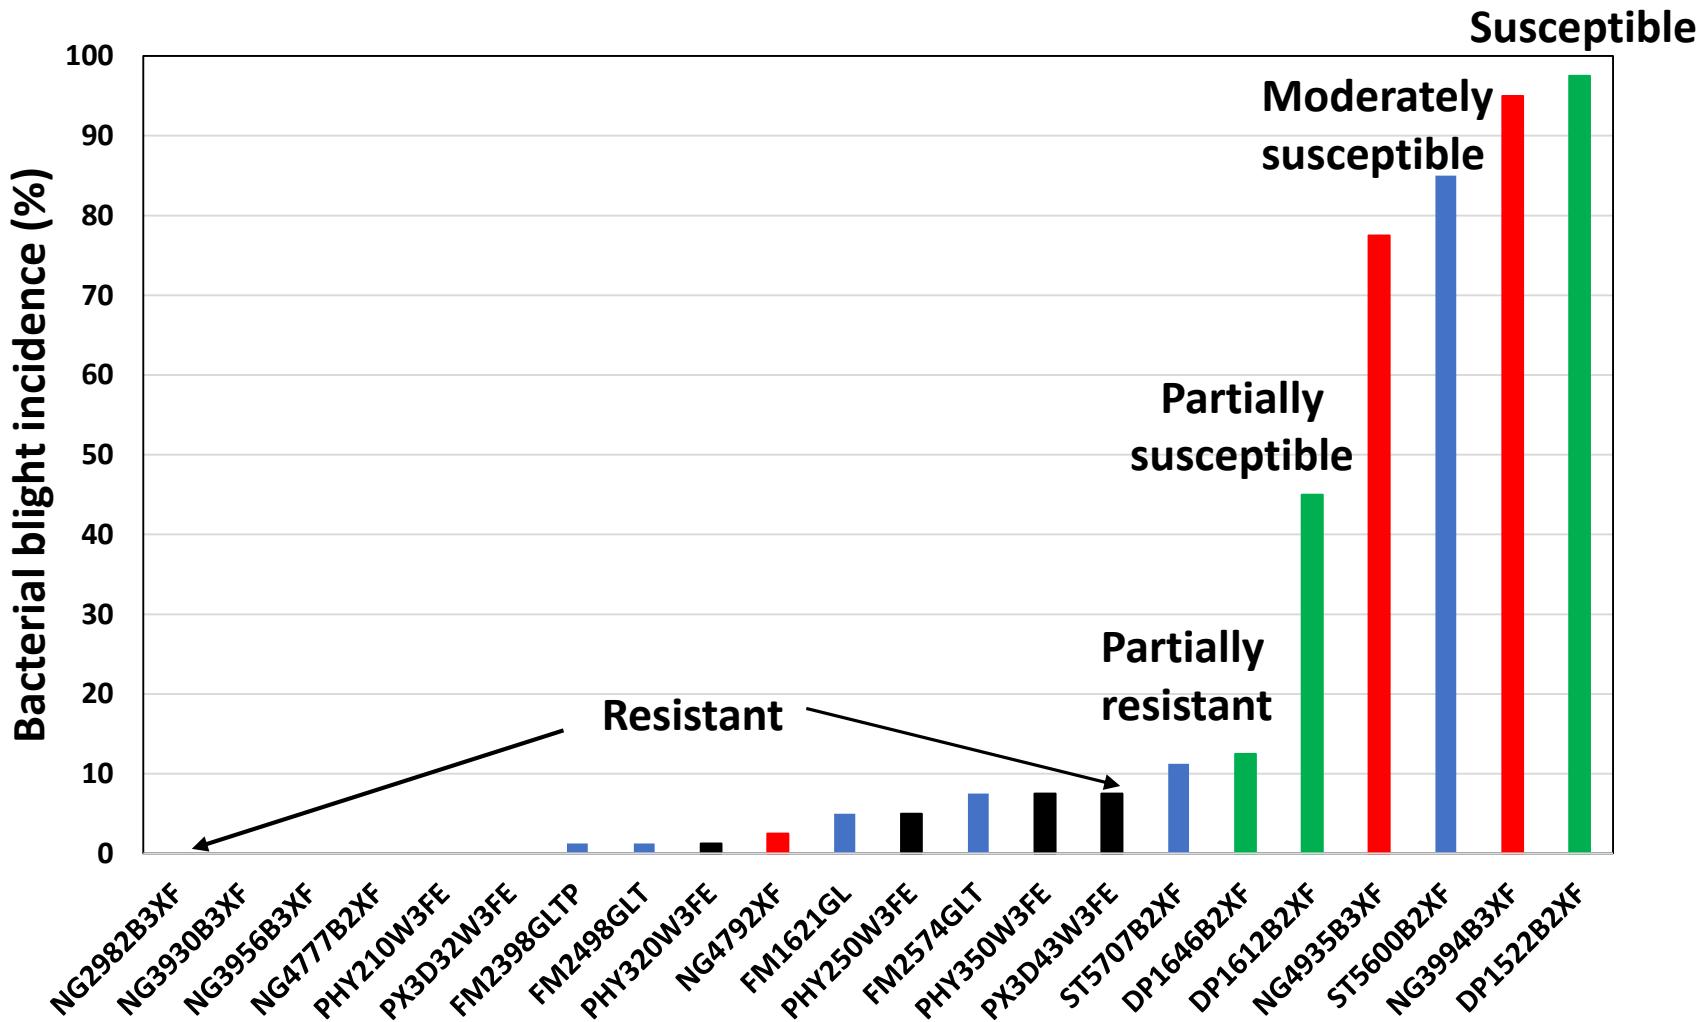

Cotton Varieties (%) planted that are susceptible to Bacterial Blight.

Performance of some new varieties when inoculated with *Xanthomonas citri* pv. *malvacearum*

I appreciate the funding sources for these projects including:

**Texas Cotton State Support
Plains Cotton Improvement Program
USDA-NIFA #TEX09672**

**Producers who donated their land area for these research projects
are: Ron Graves, Glenn Schur and Larry Smith**
