Limited Irrigation Capacity and Below Average Rainfall

1. Crop establishment

- Benefits of cover crops
- Irrigation system options

2. Seasonal irrigations

- reduce water value (irrigation & rainfall) by spreading water too thin

3. Irrigation timing

- early season irrigation
- irrigation termination

Traditional

2013 -2017

Early Yield = 1755 lb/ac

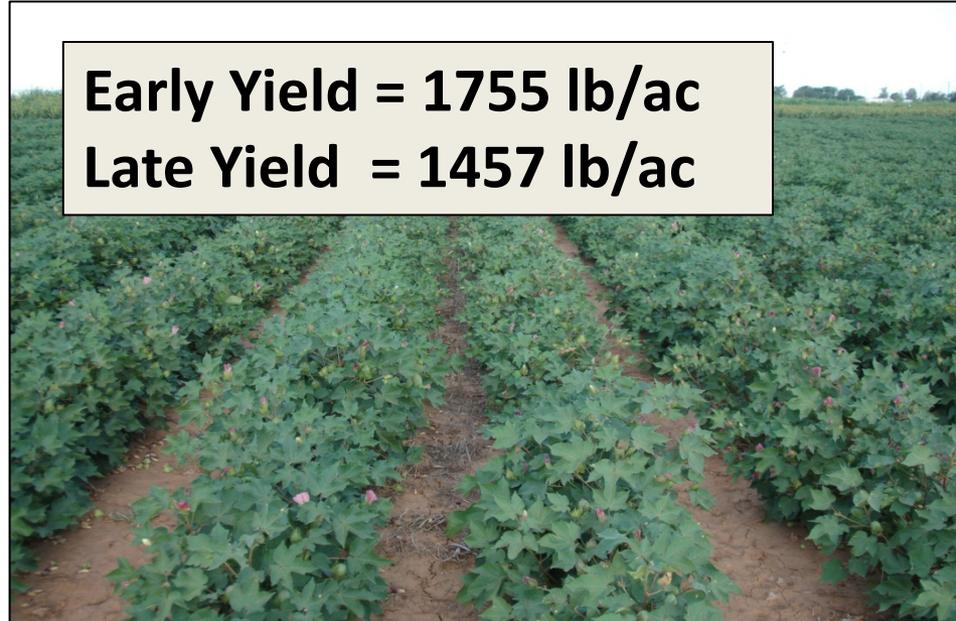

Late Yield = 1457 lb/ac

Traditional

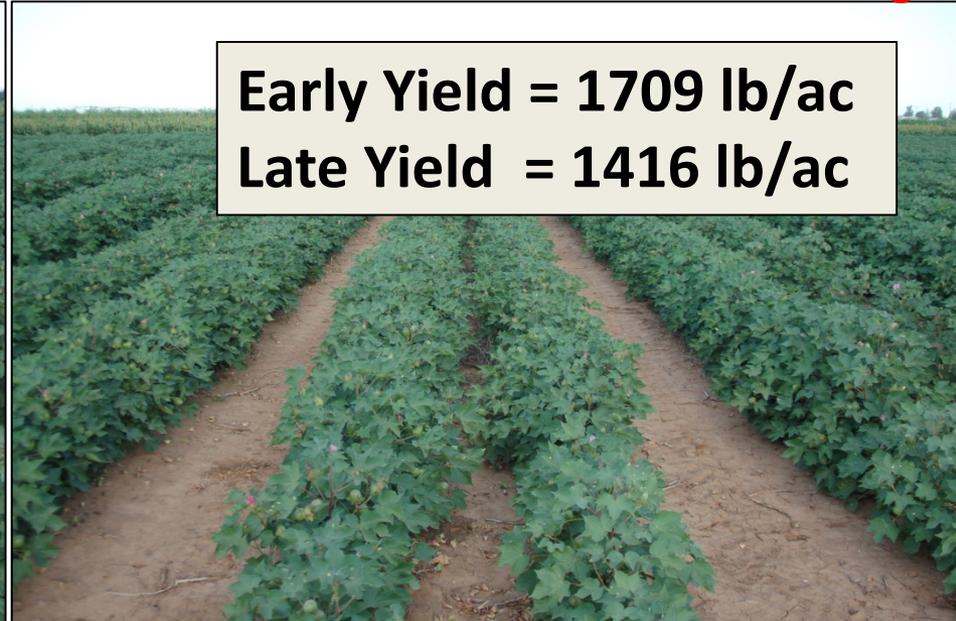

2013 -2017

30-50 Planting

Early Yield = 1755 lb/ac
Late Yield = 1457 lb/ac

A photograph of a traditional planting field. The rows of plants are wider apart, and the plants themselves are more densely packed within each row. The field is lush green, and the soil between the rows is visible.

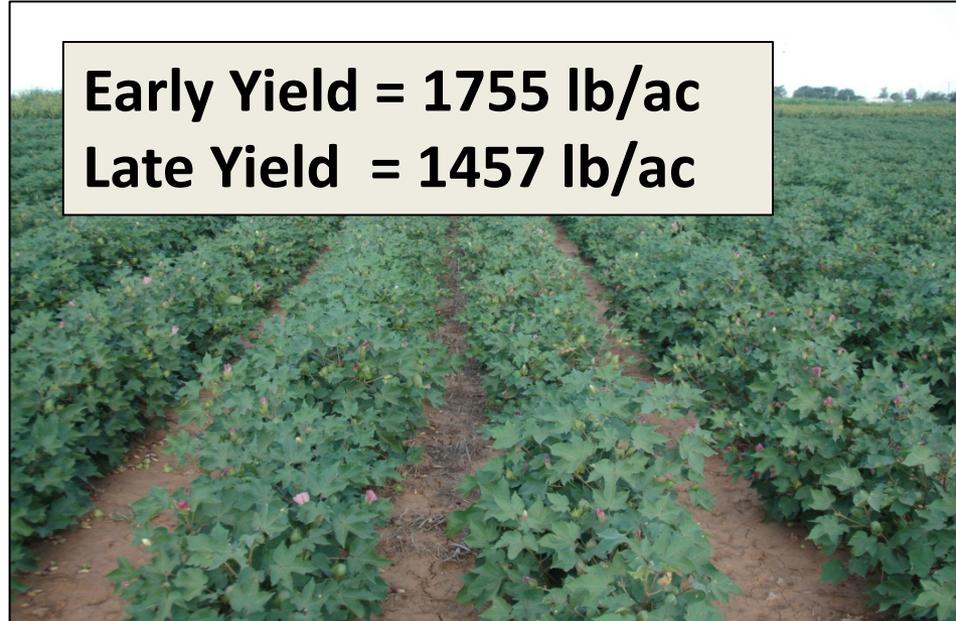

Early Yield = 1709 lb/ac
Late Yield = 1416 lb/ac

A photograph of a 30-50 planting field. The rows of plants are narrower and more closely spaced than in the traditional field. The plants are also lush green, and the soil between the rows is visible.

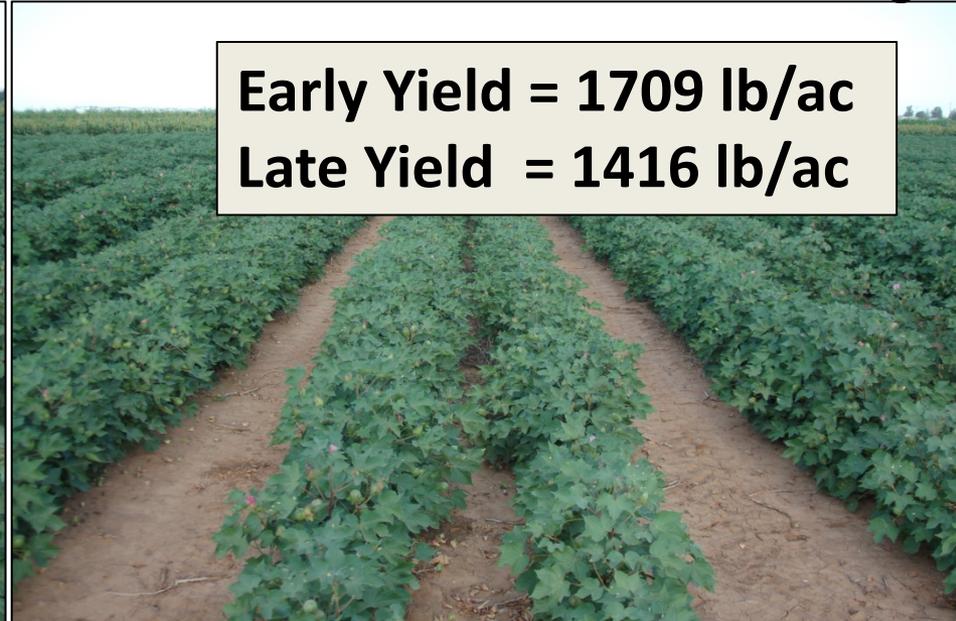

Traditional

2013 -2017

30-50 Planting

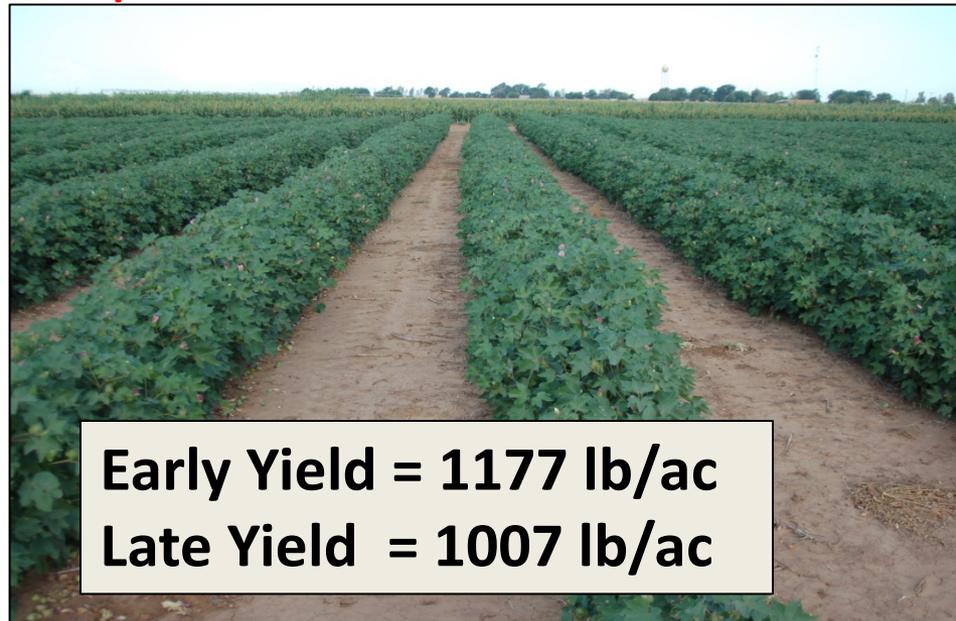

A photograph of a traditional soybean field with rows of plants and narrow, closely spaced paths.

Early Yield = 1755 lb/ac
Late Yield = 1457 lb/ac

A photograph of a 30-50 planting field with rows of plants and wider, more distinct paths compared to the traditional method.

Early Yield = 1709 lb/ac
Late Yield = 1416 lb/ac

Skip Row

A photograph of a skip row planting field, showing rows of plants with significantly wider gaps between them.

Early Yield = 1177 lb/ac
Late Yield = 1007 lb/ac

Traditional

2013 -2017

30-50 Planting

**Early Yield = 1755 lb/ac

Early Yield = 1388 lb/ac
Late Yield = 1157 lb/ac

Current Conclusion

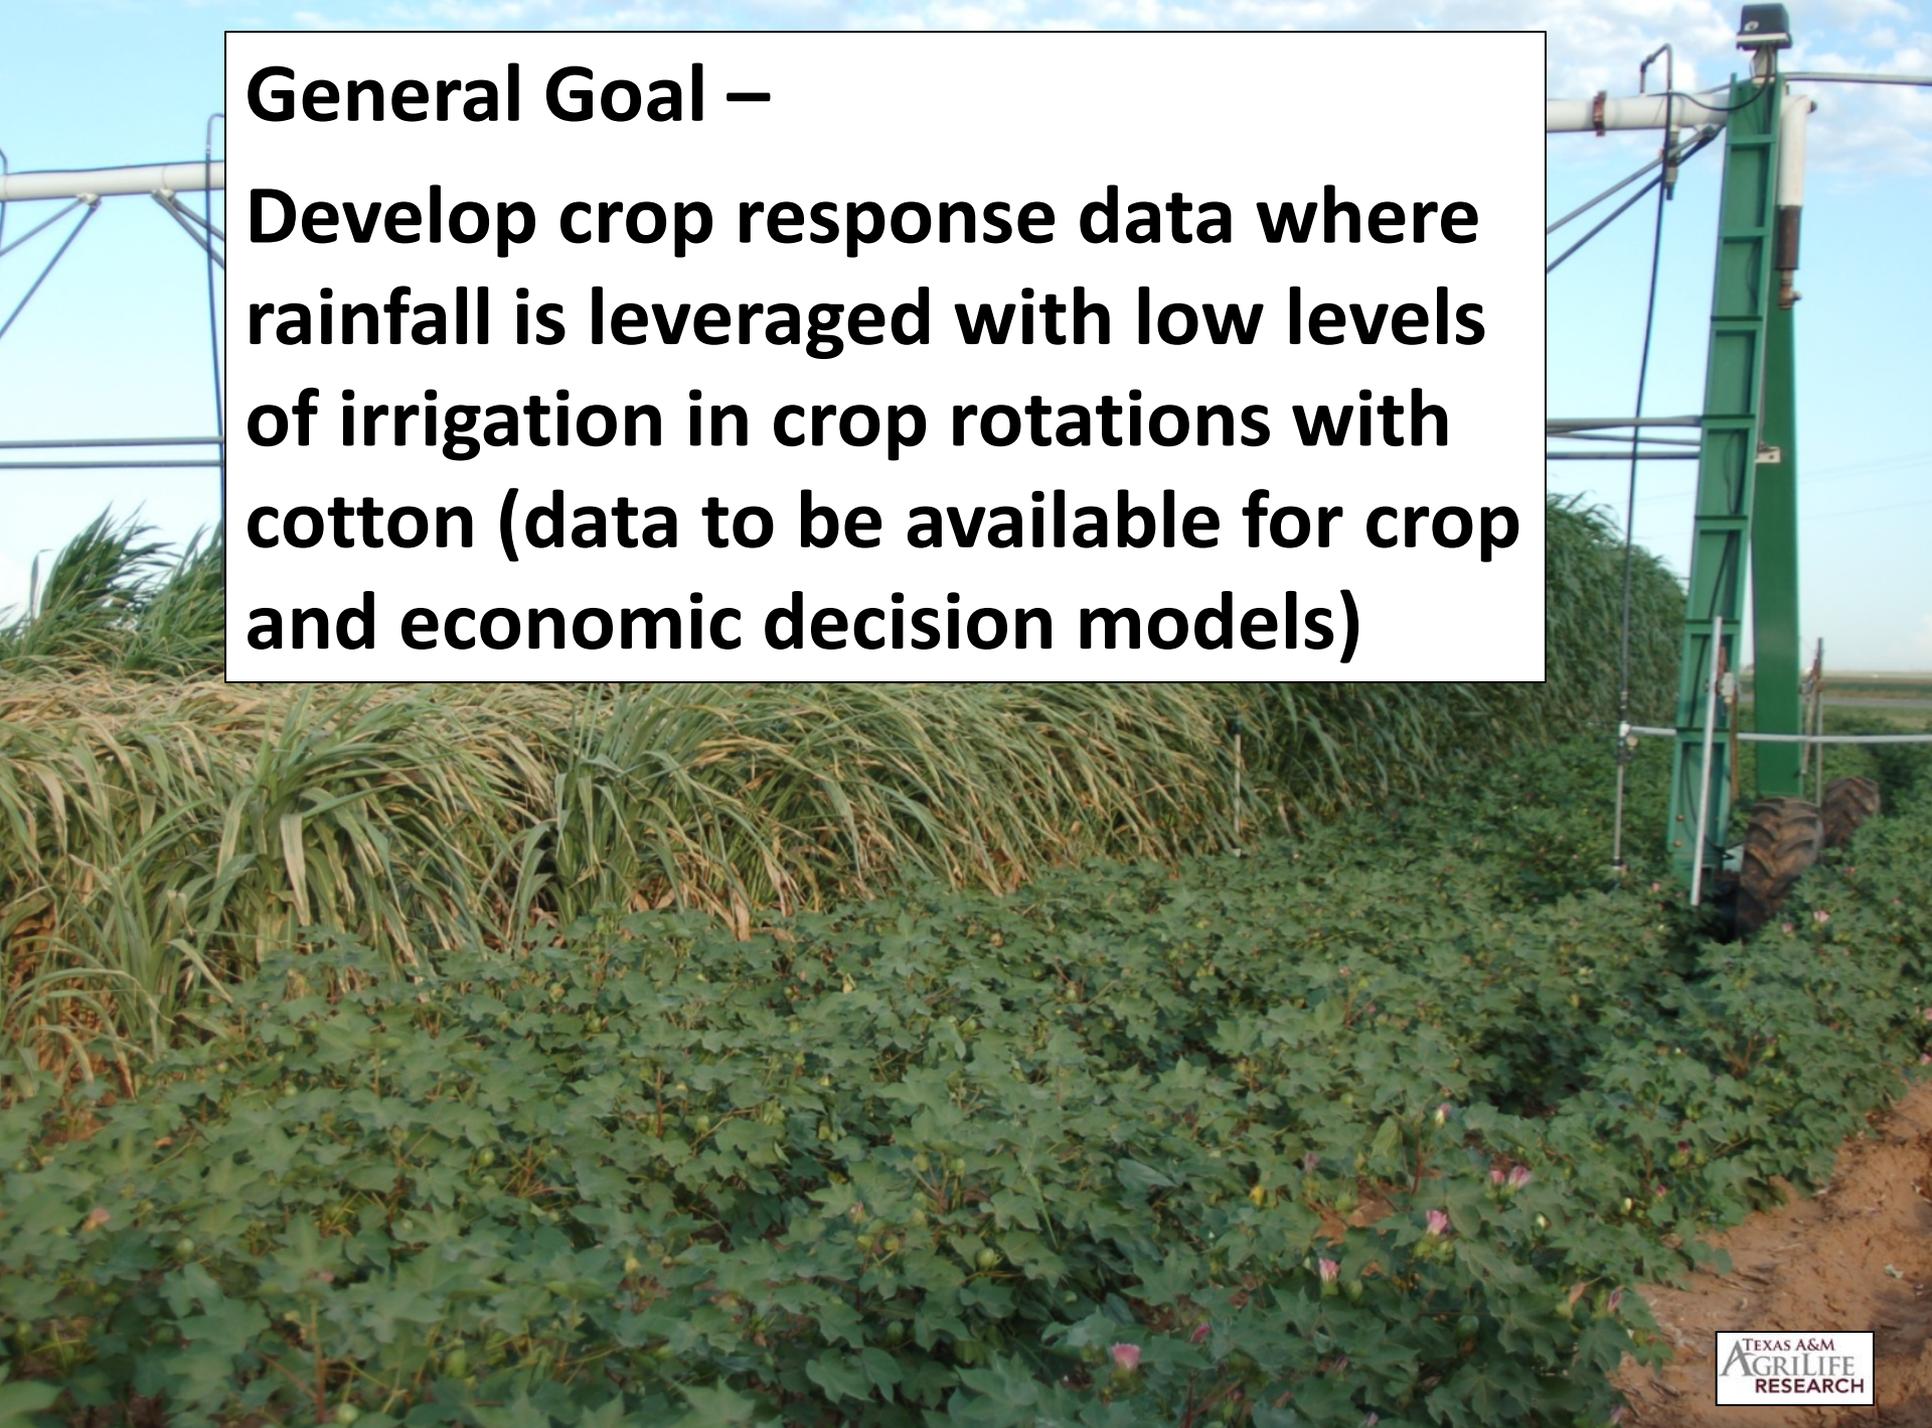

- **Wait for water to plant.**
- **As a last resort, plant in skip-row pattern late in planting window.**

Water Value is Reduced by Spreading Irrigation Too Thin.

General Goal –

Develop crop response data where rainfall is leveraged with low levels of irrigation in crop rotations with cotton (data to be available for crop and economic decision models)

General Goal –

Develop crop response data where rainfall is leveraged with low levels

One Conclusion

- Attempting to build “profile water” early in growing season (with pivot irrigation) reduces irrigation water value.

A large center pivot irrigation system is shown over a field of green crops. The system consists of a long metal structure supported by multiple wheels, with numerous vertical pipes extending down to the ground. The crops are lush and green, and the sky is clear and blue. In the background, there are some buildings and trees.

Thank You....
